TITLE: Linear theory of pile-up of ships in feed-through berth structures

SOURCE: Ref. zh. Vodnyy transport, Abs. 9B101

REF SOURCE: Nauchn. tr. Upr. uchebn. zavedeniy M-va morsk. flota SSSR, no. 1, 1965,
30-37

TOPIC TAGS: harbor facility, harbor engineering, ship navigation

ABSTRACT: The interaction between the ship and a section of the berth can be described with sufficient degree of accuracy by a system of five differential equations. No account is taken here of the listing of the ship and of the resistance of the water. Inasmuch as the period of development of the shock process is short, the gliding of the ship during the time of impact exerts no noticeable influence (the error does not exceed 3%). The use of this assumption makes it possible to break the system of differential equations into two parts. By solving one part of the system, it is possible to determine the force acting on a compartment and its transverse deformation. Integration of the second part of the system makes it possible to determine the elements of the longitudinal displacement of the compartment. An analysis of the theoretical solution and of the results of laboratory tests leads to the conclusion that several successive impacts of the ship against the berth occur. The strongest impact is the second or the third. It is indicated that it is impossible to design berth structures

ACC NR AB6035390

in a way as to allow for a series of shocks occurring during the process of dynamic pile-up of the ships. This phenomenon can be avoided either by increasing the compliance of the bumper devices, or by decreasing the compliance of the entire structure. It is considered inadvisable to use shock absorbing bumper devices to reduce the stresses in the piles and other elements of the structure during the pile-up of the ship against the berth with vertical large-compliance pile supports. For structures with little deformation (trestle-type pile supports) an increase in the compliance of the bumpers makes it possible to decrease the acting force and the deformation of the structure as a whole. The compliance of the bumper device and of the structure are not equivalent. In this connection, doubts are expressed concerning the correctness of the formula given in SN-144-60 for determining the force of impact of a ship. This formula can be applied, with a certain degree of error, for low-compliance berth structures, and the error will increase with increasing structure compliance. In the case of a pile-up in berths with vertical pile supports (when a series of impacts is observed), the formula of SN-144-60 is not applicable at all. 3 illustrations. TITLE: On electric property of filiform silver single crystal investigated
as a function of temperature

SOURCE: Acta physica polonica, v. 24, no. 1, 1963, 3-12

TOPIC TAGS: electrical resistance, filiform crystal, low temperature physics,
cryogenics, filiform silver, monocrystal silver

ABSTRACT: The principle task of this experimental investigation was to de-
termine the electric resistance of filiform silver single crystals at room
temperature down to 1.77 - 4.2 K. The diffusion scattering of conduction elec-
trons from the surface as a result of changes in whisker diameter was also
under study. The effect of various temperatures on the specific resistance
was compared for silver wires and whiskers. The authors describe the method
and equipment used in this study and the conditions under which it was carried
out, as well as the techniques used to prepare the specimens. The minimum of
resistance for silver whiskers was determined.

~~electrifikatsii~~ (1952) In Russian.

Data and characteristics are given of local power

Sources such as river water power and peat. A general outline is made of an electrification programme from the 1950 level (90 kWh p.a. per capita, 2.5 kW installed motive power per electrified farm) in 4 stages up to a level of 1130 kWh per capita. Regional 20 kV systems are recommended with mainly hydro power generation, to be connected to a State 110 kV system with few large thermal power stations.

In Russian.

The economics of the distribution of electric power in rural districts is discussed in a theoretical fashion. In particular the choice of the optimum angle between the main and feeder lines in a radial network is studied. The cross-section of these lines is determined either by permissible voltage drop or by the economic current density and these alternatives are each carefully considered. Formulae are derived from which it is intended design curves could be plotted. Using these the influence of local conditions on a line of chosen angle can be estimated. S. C. DUNN

Seri' trudy Konferentsii po khimi bor'a i yego soyedinenii (Boron: Transactions of the Conference on the Chemistry of Boron and Its Compounds). Moscow, Gostkhizdat, 1955. 189 p. Kratka slip. Inserted. 2,400 copies printed.

M.: 8.7. Izobrazitely. Tech. Ed.: M.S. Lar'yova.

PROFESS. This book is intended for chemists, as well as for industrial personnel, working with boron and its compounds.

COVERAGE: This collection contains 28 studies on the chemistry, crystalline structure, physicochemical properties, and technology of boron and its compounds. Twenty-two of the studies were presented at the All-Union Conference on Boron Chemistry, held at the Muchnoi-Izaledovets'kii district, Khimicheskii Institut im. L. Ya. Karpova (Scientific Research Physicochemical Institute im. L. Ya. Karpova) in

Kharkov. This book is intended for chemists, as well as for industrial personnel, working with boron and its compounds. December 1955. One of these articles deal with the thermodynamics of boron. The two studies on borundum production are being published for the first time. The studies are well illustrated and accompanied by bibliographies.

"Immunolectrophoretic Studies of the Serum and Aortal Wall Extracts of Deceased Persons."

Warsaw, Postepy Higieny i Medycyny Doswiadczonej, Vol 17, No 3, 63, pp 355-359.

Abstract: The investigation -- a continuation of a series attempting to determine whether biological changes occurring in sclerosis originate in the blood or in the walls of the blood vessels -- deals with the study of the factor responsible for a third line of precipitation in immuno-electrophoretic tests. It was established that it also appears in extracts of the aorta of deceased sclerotic patients, but since it is more discernible in the blood, the assumption is made that it originates there and -- under certain circumstances -- passes into the wall of the vessels. There are 15 references, of which 5 are Polish, two in German, and eight are Western.

"Role of the Pituitary-Hypothalamic System in Regulation of Estrus."

Lublin, Medycyna Weterynaryjna, Vol 21, No 10, Oct 65; pp 610-614.

Abstract [English summary modified] : Comprehensive didactic review of the role of various hypothalamic and pituitary regulatory mechanisms in sexual growth and estrous cycles in mammalian females, based primarily on several dozen recent Western studies with authors cited in text, published over the past 30 years. Three anatomical diagrams show what is known of the functional localization of the centers involved.

AUTHOR: Mazurczyk, Wojciech, Engineer

TITLE: Some remarks on relief shaping of topographical maps 1 : 10,000 and
1 : 5,000

PERIODICAL: Przegląd geodezyjny, no. 10, 1960, 359 - 363

TEXT: The author generally describes and calculates the average permissible error in relief shaping of topographical maps. On a topographical map 1 : 10,000, the average error of ± 2 m does not mean that larger errors are not present. According to the Koppe formula the average error of contour height is $m_w = \pm (m_h + m_p \operatorname{tg} \alpha)$, where m_h = height error, m_p = location error. According to Heissler's assumption, for 1 : 15,000 photographs $m_h = 0.6$; $m_p = 1.5$ m and $m_w = \pm (0.6 + 1.5 \operatorname{tg} \alpha)$. After substituting given values the inclination angle of the terrain is obtained in meters, m_w . If these values were to be changed for linear shift, then m_1 will be: $m_1 = \pm (m_h \operatorname{ctg} \alpha + m_p)$; $m_1 = \pm (0.6 \operatorname{ctg} \alpha + 1.5)$. As is seen from the above, these magnitudes are larger especially for flat, $0^\circ - 60^\circ$, and rolling ground, $60^\circ - 20^\circ$. However, the location of contour should shift only by the thickness of line, 0.2 - 0.3 mm. Flat ground presents greater difficulty

A076/A126

and in some cases it is necessary to shift contour location by more than 0.2 - 0.3 mm. This shift does not alter the height error. However, accurate and frequent height spotting eliminates errors and gives accurate location of contours. The second difficulty terrain where the preparation of a manuscript map is difficult are woodlands and covered ground. Investigations showed that maps of woodlands are prepared 2 - 3 times less accurately than those of flat ground. In such case the topographer should have sound knowledge of hydrography, and measurements should be made during summer when the water level is lowest. As an example the author compares three manuscript maps representing woodland and rivulet courses. There are 3 tables and 5 figures.

TITLE: The Application of Infrared Lamps in Analytical Practice
(Применение инфракрасной лампы в аналитической практике)

PERIODICAL: Zavodskaya Laboratoriya, 1957, Vol. 23, Nr 7, pp. 878 - 878 (USSR)

ABSTRACT: On the occasion of the analysis of many anorganic compounds the necessity arises to evaporate a solution until it is completely dry, as, for instance, when determining the alkali metal content in zinc salts, cobalt, manganese, etc. - For this purpose a solution is dried out under an infrared lamp. The device concerned consists of a aluminum body and the infrared lamp. By increasing or reducing the distance between the lamp and the vessel it is possible to regulate temperature ad libitum. There is 1 table.

Investigation of the *In vitro* action of chloromycetin on aerobic bacteria. C. Mazurek (Inst. Pasteur, Paris). *Ann. Inst. Pasteur* 79, 305-8 (1950); *Chem. Zentr.* 1951, I, 3205; cf. preceding abstr.—The Janus green rapid method was used to determine the chloromycetin sensitivity of 104 strains of anaerobic bacteria representing 95 varieties or types. The inhibiting concns. varied between 0.1 and 100 γ . The anaerobic bacteria were less sensitive (*in vitro*) to chloromycetin than to penicillin, streptomycin, or tyrothricin. The organisms most sensitive to chloromycetin included the strongest toxin-formers, such as *Clostridium* A, B, and C, *C. edematis* (inhibited by 0.1 γ), and *C. botulinum* D (0.6 γ); the most virulent organisms, such as *Fusiformis fusiformis*, *Sphaerophorus pyogenes*, *Ristella insolita*, *R. clostridiformis*, *Capsularis stolzii*, *Neisseria rufogrinidis*, *Corynebacterium parvum*, *Zuberella nova*, *Z. serpens*, and *Clostridium helminthoides*; the anaerobic staphylococci (0.1 γ); and the nonpathogenic *C. felsineum*, *Pectinidium tetanomorphum*, and *P. capitulalis*. The gas-gangrene clostridia (with the exception of *C. edematis*) and *C. tetani*, as well as *Sphaerophorus* (except *Sph. pyogenes*), were not very sensitive to chloromycetin.
